HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

DETAILED ACTION

Examiner's Amendment

Claims 3-7, 10-12 and 14, 17-19 and 21, and 22-24 have been renumbered 1-16, respectively.

Allowable Subject Matter

Claims 3-7, 10-12 and 14, 17-19 and 21, and 22-24 are allowed.

The following is an examiner's statement of reasons for allowance:

Consider independent claims 3, 10, 17 and 22, the best prior art of record found during the examination of the present application are: **Nelson et al. (US 2003/0060224, herein Nelson)**, **Baker et al. (US 2002/0094834 herein Baker)** and **Chen et al. (US 2003/0134655 herein Chen)**.

In view of the present application, Nelson discloses sending a reference signal with pilot information to multiple units on the forward link. A message is also transmitted to the units on the paging channel with the Effective Radiated Power (ERP) of the reference signal. The power level of the received signal is measured at the transceiver and is compared with the effective radiated power level information. Based on the comparison result, the forward path loss of the forward link is estimated. An assumption is made at the unit, that the reverse path loss is the same as the forward path loss. Thus the unit can transmit signals at a transmit power level to the base station at a desired power level. This in effect, would lower the co-channel interference.

In view of the present application, Baker discloses a system employing parallel power loops in order to select the best transmitting station for high speed data transfer to the mobile station. The parallel power control loops aid in selection of control parameters to improve link robustness and system throughput.

In view of the present application, Chen discloses a power control system for point-to-multipoint communication services in which transmission power on the forward path as well as the reverse path are minimized so as to reduce interference.

Accordingly, in light of the cited references, the present invention is novel and non-obvious since the prior arts of record do contain either explicitly or implicitly the limitations as a whole as disclosed in the independent claims. In addition any reasonable combination of the cited references cannot be used to reconstruct the claimed invention. Therefore, the present application as claimed is allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

- Andersson et al. (US 6,334,047) discloses system with power control to adjust transmission power by checking the Carrier-to-Interference Ratio (CIR) received from the mobile at every timeslot. The CIR is compared to a desired threshold and a power adjustment is transmitted to the mobile.
- Brooks (US 7,058,400) discloses a system that dynamically controls the forward and reverse link channel processing gains to minimize dropped connections and improve the reliability to hard handoffs.
